Professional Summary

Application security engineer with 2+ years at Deep Armor building detection and AI-assisted validation tooling. Co-authored Semgrep rules for OWASP Top 10 classes across Python, Java, JavaScript, and TypeScript (<15% false positives) that power an AI-driven SAST engine for an enterprise SaaS client. Now validates the engine's findings, including multi-step vulnerability chains, through code review and live testing. Also built AWS and Azure CSPM checks mapped to CIS, NIST, HIPAA, and RBI.

Skills

- **Security:** Application Security, SAST, Vulnerability Validation, Cloud Security (CSPM), Secret Detection, Web & API Security Testing, Post-Quantum Cryptography
- **Tools:** Semgrep (custom rule authoring), Gitleaks, TruffleHog, Boto3, Azure SDK, Pytest, Moto, Linux
- **Languages:** Python, Java, JavaScript, TypeScript, SQL
- **Cloud & Compliance:** AWS and Azure; CIS Benchmarks, NIST, HIPAA, RBI, GDPR
- **AI:** Agentic security workflows (LLM skill files, sub-agent review, MCP integrations), prompt engineering

Experience

Security Engineer II | Deep Armor
March 2026 - Present

- **AI-SAST Finding Validation:** Validate findings from an AI-powered SAST engine for an enterprise SaaS client, including multi-step vulnerability chains built from several individual findings. Confirm exploitability through source code review, live testing, architecture analysis, and discussion with the client's developers.
- **Verdicts & Prioritization:** Classify each finding as true positive, false positive, not exploitable, or uncertain, and assign P-ratings to confirmed vulnerabilities to set remediation order.
- **Agentic Validation Workflow:** Designed 8- 9 LLM skill files that guide an AI agent through structured finding investigation, including an independent sub-agent review for a second opinion. Verdicts are logged to a shared repository and tracking sheets through MCP integrations. Cuts first-pass investigation from 1- 2 days to minutes, with every final verdict human-reviewed.

Security Developer | Deep Armor
June 2024 - February 2026

- **SAST Rule Engineering:** Co-authored custom Semgrep rules extending OWASP Top 10 coverage (SQL injection, command injection, XSS, CSRF, SSRF) across Python, Java, JavaScript, and TypeScript. The rules fed an AI-powered SAST engine that analyzes findings individually and as multi-step attack chains. Tuned detection logic to hold false-positive rates below 15%.
- **Cloud Security (CSPM):** Engineered detection logic for a multi-cloud CSPM tool, building AWS and Azure misconfiguration checks mapped to CIS Benchmarks, NIST, HIPAA, RBI, and other compliance frameworks. Added PDF export for compliance reports.
- **S3 Exposure Verification:** Built a Python utility that confirms public S3 bucket exposure through multi-factor verification rather than a single configuration signal.
- **Post-Quantum Cryptography Detection:** Developed static analysis rules identifying post-quantum cryptography (PQC) library usage across 11 programming languages.
- **Security Testing:** Performed security testing of MFA implementations across web front-ends and API endpoints.

Security Research Intern | Deep Armor
August 2023 - June 2024

- Automated cloud resource auditing with Python (Boto3, Azure SDKs). Authored the initial AWS and Azure compliance logic that became the foundation of the company's CSPM engine.

Activities

- Represented Deep Armor and the Gauntlet platform at the Bengaluru Tech Summit.
- Competed in CTFs (cryptography, OSINT) as part of the Deep Armor team.

Education

Bachelor of Engineering (B.E.) | BNM Institute of Technology **May 2024**
Computer Science and Engineering (CGPA: 9.11)
